WATT BOX®

Think You Know Power? Think Again.

Designed to revolutionize how you think about power, WattBox delivers professional-grade power that saves you time, reduces service calls, and proactively protects your client's hardware.

Every Install Needs WattBox

From ultra-compact to in-rack power solutions, WattBox has a device to power your install. Power and control everything you need to fix a locked-up smart TV, streaming device, or even an entire system with WattBox.

Smart Power Innovation

Take control of your installs with IP power. With IP power from WattBox, you get access to individually metered and controlled outlets for advanced troubleshooting and the ability to reboot single devices without disrupting the entire system.

Powered by Peace of Mind

Pair your IP WattBox with an OvrC-enabled WattBox Uninterruptible Power Supply (UPS) to safely back up your equipment in case of power failure. With a UPS you can prioritize equipment to maximize runtime of mission-critical subsystems.

For Serious Surge Protection

WattBox offers traditional Power Distribution Units in compact form factors to give you convenient power where you need it most.

Empower Your Installs with Remote Management

WattBox+OvrC provides an operationally essential solution to our partners, arming them with the ability to configure, monitor, and troubleshoot the installation remotely, with features including resetting individual outlets, setting reboot schedules, enabling auto-reboot for problematic devices, and notifications alerting the integrator when an event has taken place, or an action is required.

WattBox+OvrC: The Power of Control

How many times have you driven to the job site to fix an issue only to discover the solution is a simple reset? Thanks to WattBox and OvrC, those days are gone. OvrC, the industry's leading free remote management platform, coupled with WattBox, can resolve common service issues that can be resolved with a simple reboot. With individually metered outlets you can remotely reboot the device with the press of a button.

Self-Healing Auto Reboot

Maintaining connectivity to the internet is critical in today's smart home, so our IP products continuously monitor connectivity and automatically reboot troubled devices when the connection is lost. You can even schedule regular reboots through the local UI or OvrC platform.
